

# Code protection and attacks against IlMatto

Dionisio Perez-Mavrogenis

February 7, 2014

This research project will look at the various issues concerned with protecting Intellectual Property(IP) in microcontroller units. The motivation behind this is the rise of the "Web of things", a notion that everyday devices will have microcontrollers embedded

- explore ethical issues?

- explore current attacks

- consider il mato architecture, review capabilities for protection and how they withstand current attacks

- make specific to ilmatto, always more interesting rather than an abstract model
